Abstract—The purpose of this study was to determine if there were differences in the prevalence of musculoskeletal disorders between two groups of nurses working in different departments of a hospital. The sample consisted of 100 nurses from the intensive care unit (ICU) and 100 nurses from the medical-surgical department. Data were collected by means of a questionnaire about demographic characteristics, work conditions, and musculoskeletal symptoms. A chi-square test was used to compare the prevalence of musculoskeletal disorders between the two groups. Results showed that the prevalence of musculoskeletal disorders was higher among ICU nurses than among medical-surgical nurses. The results suggest that nursing professionals working in the ICU are more exposed to risk factors for musculoskeletal disorders.
